

Word Counting Program Instructions

Objective: Write a Python program that reads a text file, counts the number of words, and displays statistics about the word occurrences.

Requirements:

The program should prompt the user to enter the path of the text file.

Read the text from the file and process it to count the number of words.

Display the following statistics:

Total number of words.

A number of unique words.

List of all words along with their occurrences.

Console Output Example:

```
Enter the file path: C:\SomeDir\hello.txt
Number of words: 66
Number of unique words: 54
All words used:
Benefactor 2
in 1
total 1
You 1
mustard 1
It's 1
if 3
1 more
...
```
